ApisnixPhone is your business phone in the browser: nothing to install, you open the page, sign in and call.

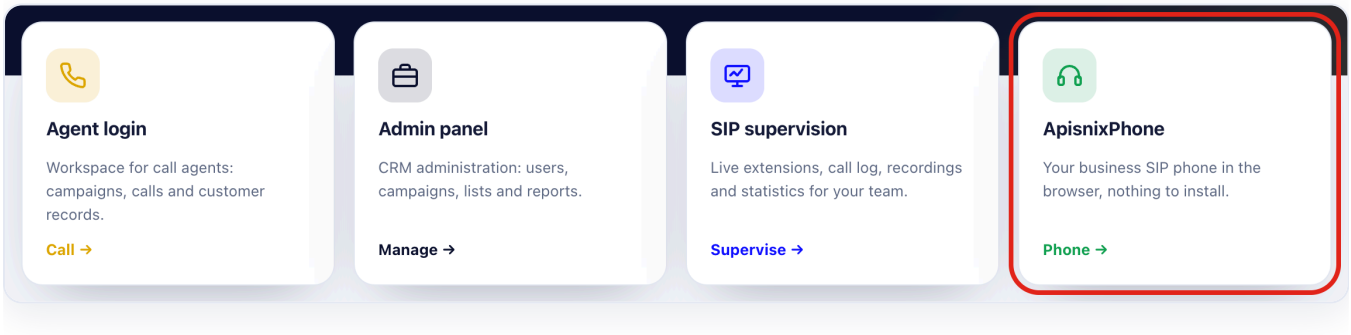

The screenshots in this guide come from the demonstration: names and numbers are fictional. Version described: ApisnixPhone Web 0.1.0.

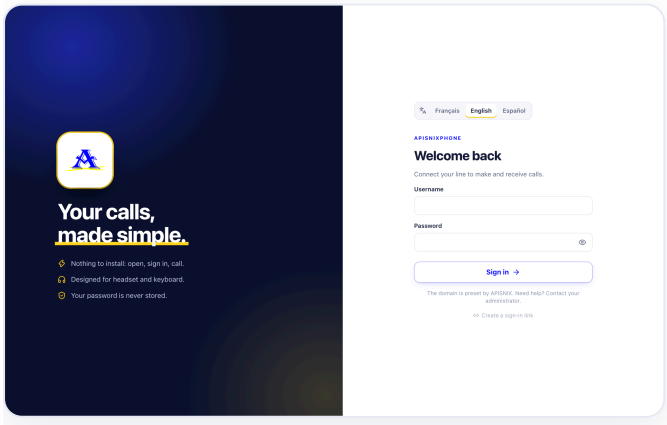

Before you start

- A computer with an up-to-date **Chrome or Edge** and a stable connection. Safari can make calls but is not recommended: its sound cues are unreliable.
- A **headset with a microphone**: it makes the quality of your calls.
- Your **username** and **password**, or a **sign-in link**, given by your administrator.
- Keep the tab open and the computer awake: if the page is closed or the PC goes to sleep, you no longer receive calls.

1. Sign in

Open https://apisnix-crm.com and choose the **ApisnixPhone** card, or go straight to https://phone.apisnix-crm.com.

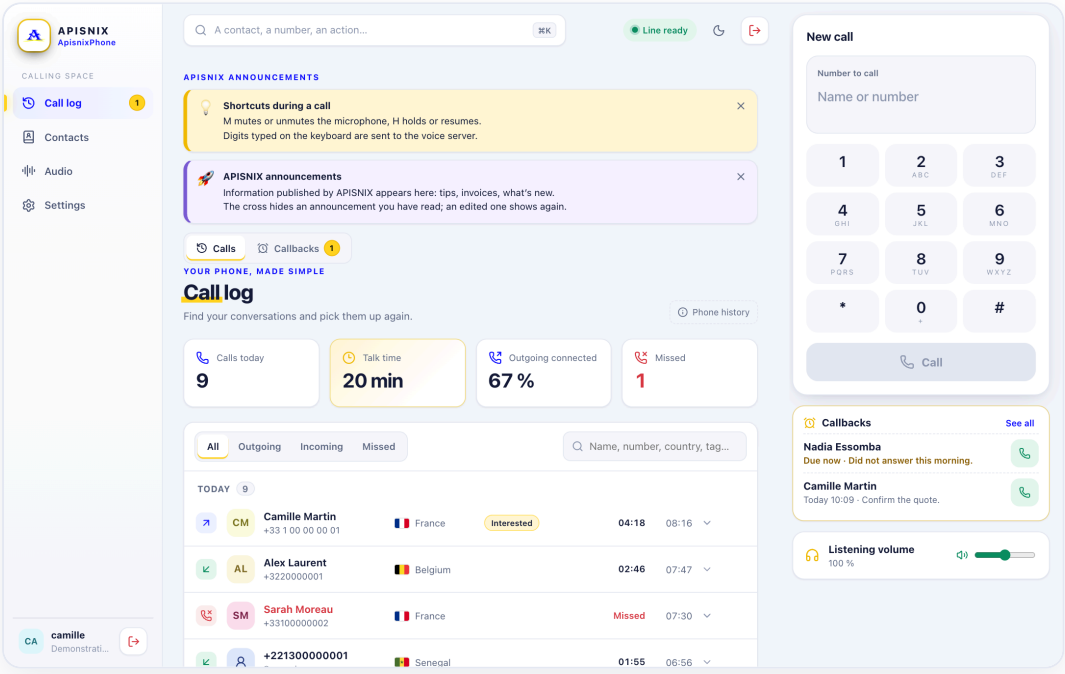

At the top of the form, choose your **language**: Français, English or Español. The browser remembers it; you can also change it in Settings → Appearance. Then enter your username and password, and click **Sign in**. ApisnixPhone never stores your password. Your browser may offer to save it: if you accept, reloading the page signs you back in by itself (Chrome, Edge) or fills in the form (Safari). **Decline on a shared computer.** Received a **sign-in link**? Click it: the line connects by itself, with nothing to type. It contains your password: do not share it.

Message	What to do
Username or password refused	Check what you typed (capitals, zeros). The app does not retry by itself.
Cannot connect to the server	Check your network, then try again.
This line is already open in another tab	Close the other ApisnixPhone tab. If you have just signed out in this tab, reload the page.

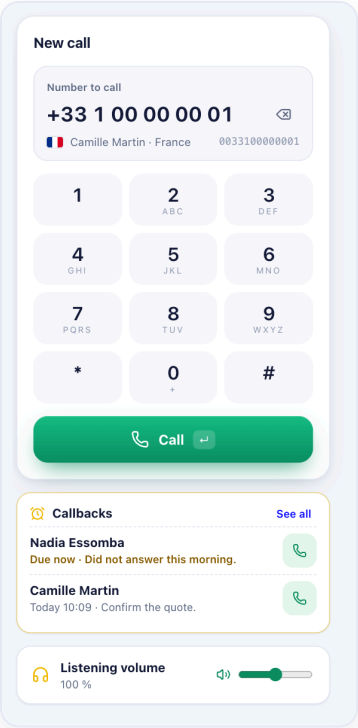

A chime sounds and the green **Line ready** badge appears: you can call. On the first call, the browser asks for access to the **microphone**: choose **Allow**. Refused by mistake? Settings → Audio → **Allow the microphone** asks again, or explains how to unblock it if the browser remembered the refusal.

2. The main screen

- **On the left**, the menu: Call log, Contacts, Audio, Settings. Callbacks are in the Call log, under the **Callbacks** tab. Your account and the red **Sign out** button are at the bottom; the same button is at the top right.
- **In the middle**, the chosen page.
- **On the right**, the phone. It stays there whatever the page: you can check your callbacks or recordings without leaving your call.
- **At the top**, the search bar and the line status.
- **Just below**, the **APISNIX announcements**: tips, invoices, news. The cross hides an announcement you have read; an updated announcement comes back.

3. Make a call

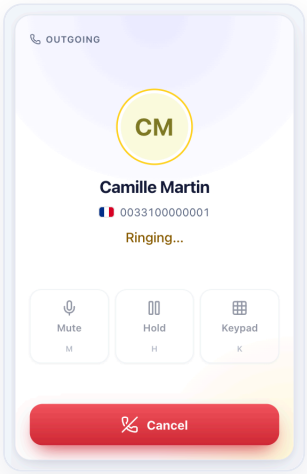

Type the number on the computer keyboard or on the keypad, then **Call** or the **Enter** key. You can also type a **name**: matching contacts are suggested.

A leading `+` is accepted: `+33` becomes `0033`; for other country codes, only `+` is removed. The grey line shows the number actually dialled. The country stays visible. Your line's routing prefixes are still required. To enter a `+`, hold **0**.

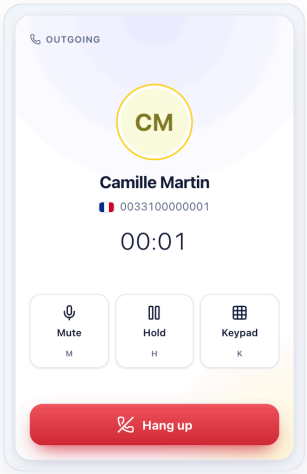

Each key of the keypad plays a short tone, like a classic phone. To turn it off: Settings → Audio, **Keypad sounds**.

A classic "beep beep" tone plays while it rings, then a short chime confirms the answer. The timer starts then, never while waiting; before that, the red button reads **Cancel**.

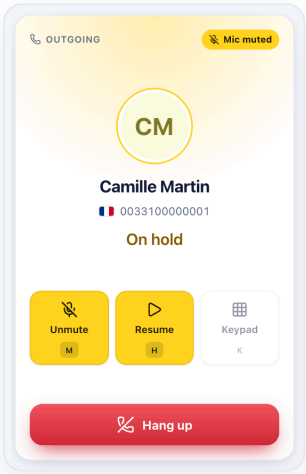

4. During the call

Ringing

Call in progress

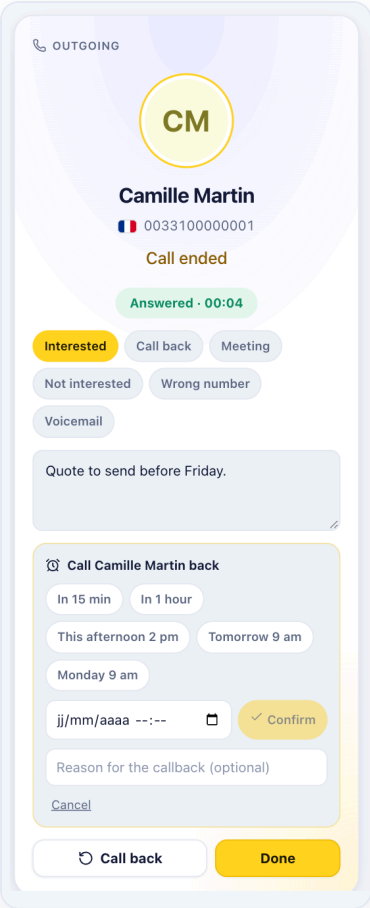

Mic muted, call on hold

- **Mute** (`M` key) turns off your microphone: the other person no longer hears you. A yellow "Mic muted" label reminds you.
- **Hold** (`H`) puts the other person on hold; **Resume** takes the call back.
- **Keypad** (`K`, or the digits) sends keys to a voice menu ("press 1…").
- **Hang up** ends the call.

Shortcuts do not work while you are typing in a field, and the Esc key never hangs up.

5. At the end of the call

The app shows the outcome and the duration. In a few seconds, you can:

- **tag** the call with one or more tags (Interested, Call back, Meeting…);
- write a **note**;
- **schedule a callback**: “In 15 min”, “In 1 hour”, “Tomorrow 9 am”, “Monday 9 am” or an exact date, with an optional reason;
- **Call back** right away, **Add** the number to your contacts, or click **Done**. Calling someone else from the Call log, Contacts or Callbacks also closes this card: nothing is lost, tags and note are already saved.

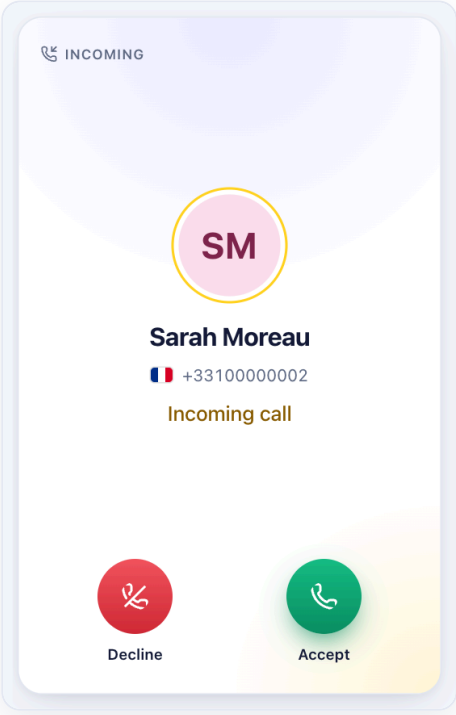

If a call fails, because of the microphone or a refusal by the server, a red box gives the reason. If it happens again, pass the code shown on to your administrator: it stays visible in the call's details in the **Call log**.

6. Receive a call

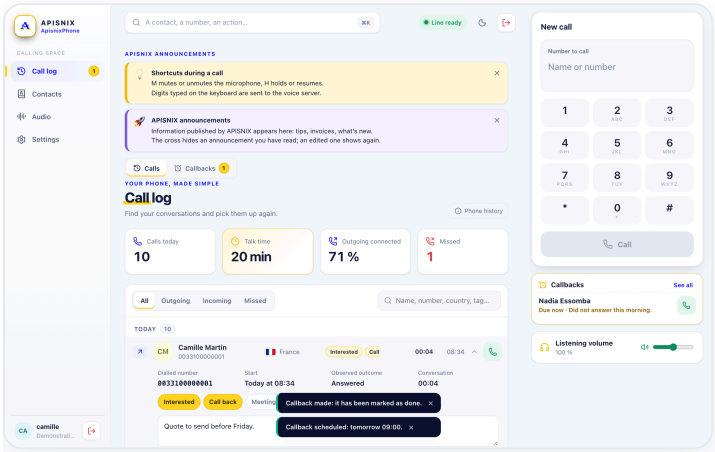

The phone rings with the ringtone chosen in Settings, comes to the front and the tab title shows “Incoming call…”.

Choose **Accept** or **Decline**: the app never answers for you.

A call left unanswered becomes **Missed** and a red badge appears on the Call log; it clears when you open it.

7. The call log

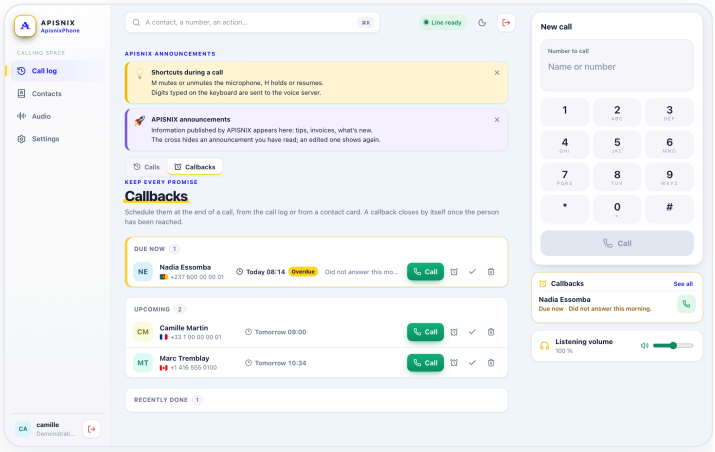

Calls are grouped by day. Filter by **All / Outgoing / Incoming / Missed** or search for a name, a number or a country. The call-back button calls again; a click on the row opens its details.

- **All calls of the extension**: the last 30 days, including calls made from another device. Refreshed every minute.
- **Phone history**: calls seen by ApisnixPhone, with your tags and notes, saved for your line.

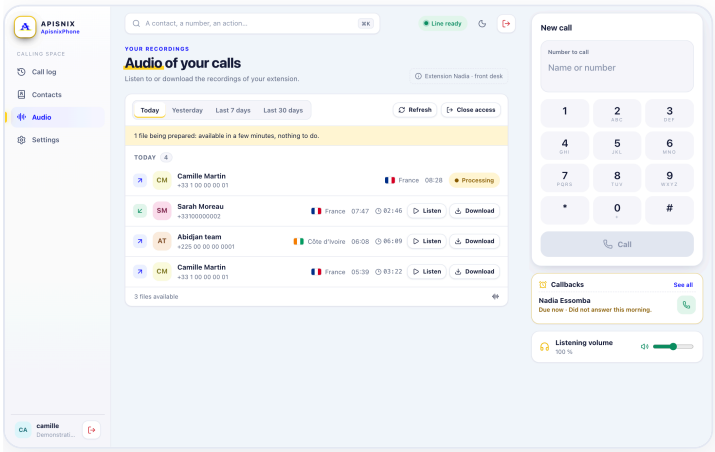

8. Callbacks

Open **Call log**, then **Callbacks**. Your callbacks are sorted into **Due now**, **Later today** and **Upcoming**. At the set time, the app reminds you and a yellow badge appears.

For each callback: **Call**, postpone by one hour, mark as done or delete. **A callback closes by itself as soon as you have reached the person.**

9. Your recordings

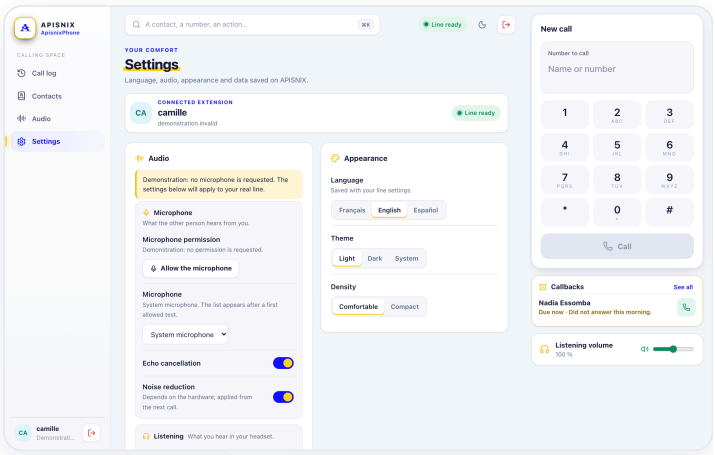

The **Audio** page gathers the recordings of your extension's calls. They appear **a few minutes after the call ends** (“Processing” until then).

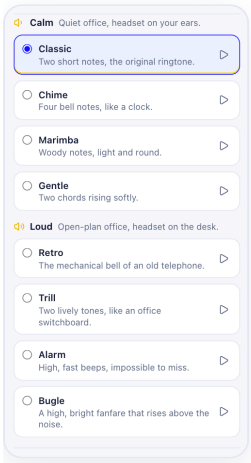

Choose Today, Yesterday, Last 7 or **Last 30 days**, then **Listen** in the page or **Download** the file. You only see the recordings of your own extension.

Nothing to type: access opens with your line. If it fails, **Try again**; otherwise, contact APISNIX.

10. Settings

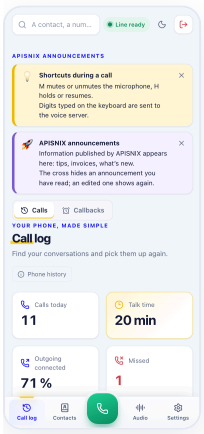

- **Connected line**: your username, server and line status. A screenshot helps support identify your line.
- **Audio**: microphone permission, microphone and headset selection, sensitivity, **Test microphone**, noise reduction and sounds.
- **Listening volume**: 100 % by default, up to **200 %**. Prefer a headset above 100 %.
- **Appearance**: language, Light, Dark or System theme, density.
- **Calls**: system notifications.

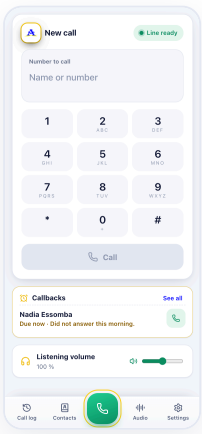

- **Ringtone**: eight sounds. The **calm** ones (Classic, Chime, Marimba, Gentle) for a quiet office; the **loud** ones (Retro, Trill, Alarm, Bugle) for an open-plan office. Tap a sound to choose it; ▶ plays it without choosing it.
- **Line data**: enable **Keep my data on APISNIX** to find it on another device. Turning it off deletes the saved copy; **Delete my data** clears contacts, notes, reminders and phone journal. Wait for confirmation. If server data is unavailable, the line still works; new entries stay in this session. Outside a call, sign in again or contact your administrator.
- **Retention**: if the subscription is not renewed or is cancelled, APISNIX does not guarantee data continuity. Reassigning the phone may permanently delete it. Calls and recordings remain accessible for 30 days.
- **Account**: your username, the version, **Sign out**.

11. On a phone or a small window

Call log on mobile

Phone on mobile

The menu moves to the bottom of the screen, with the green **Phone** button and **Audio** always visible.

During a call, a banner stays visible on every page, with its **Hang up** button.

Troubleshooting

What you see	What to do
“This line is open on another device”	**One account = one device at a time**: this phone is paused. **Take the line back here** gets it back. If it is not you, tell your administrator.
“Connection lost”, “Call interrupted” or two falling notes	The network dropped. Wait a few seconds, check your network and call again: a call is **never** redialled automatically.
Display stuck	Outside a call, open manual sign-in. Your saved data is kept.
“The microphone is blocked”	Settings → Audio → **Microphone permission**, or the icon to the left of the address → Microphone → Allow.
“No microphone found”	Plug the headset back in, then check Settings → Audio.
“Turn on sound” button	Click it: the browser had blocked the sound.
You are hard to hear, choppy voice	Often the Wi-Fi: move closer to the router or use a cable.

Good to know

- **Hang up before closing or reloading the page.** A safeguard attempts to end the call when you leave; an abrupt interruption may delay its release.
- The flag shows the country of the **number**, not where the person is. A received number without a reliable country code has an unknown country.
- For any question about your account or your calling rights, contact your APISNIX administrator.
